A pilot randomized controlled trial of treatment of abdominal abscesses in the emergency department. To determine the efficacy of prehospital computed tomography (CT) in the treatment of peritoneal abscesses. Subjects 18 years or older presenting to an urban hospital with abdominal pain, significant peritoneal signs, and a computed tomography (CT) ordered during the prehospital period were randomized to receive emergent abdominal CT or emergent intravenous (IV) antibiotic therapy. Patients assigned to the IV group received open-label IV antibiotic therapy. The primary outcome was negative exploratory laparotomy (EL) within 72 hours of enrollment 2d92ce491b
