Autosomal dominant polycystic kidney disease (ADPKD) is the most common monogenetic renal disease and is also a major cause of chronic renal failure in adult. We identified a novel mutation, Q111X (CAG repeat expansion in the 3' untranslated region), in an ADPKD case family. This mutation was detected by polymerase chain reaction amplification of the repeat and direct sequencing analysis. Direct sequencing and PCR analysis of 48 members of the family revealed that 26 patients were heterozygous for the Q111X mutation and that all 10 unaffected members were wild type.In the art of preparing a coherent thin specimen of a suitable material from a sample of the material, it is usual to crack the material or otherwise prepare it in a form which makes it suitable for providing a thin slice which is as
